

DRAINAGE REPORT

Proposed Elderly Housing Development | 343 Clintonville Road | North Haven, Connecticut

October 27, 2020 (**Revised December 8, 2020**)

MMI #2709-13

This stormwater drainage report has been prepared in support of a proposed site plan application for the 343 Clintonville Road elderly housing development in the town of North Haven, Connecticut. The applicant proposes to construct two multistory buildings with 120 residential units total as well as an associated clubhouse with outdoor patio.

The ±12.8-acre parcel abuts residential properties to the west, the ACES – Wintergreen Interdistrict Magnet School to the north, and the Tuscan Villa development to the east. The parcel was previously zoned as R40 and has recently been approved to be zoned as Elderly Housing (EH). The parcel is mostly wooded north of Waterman's Brook with farmland to the south of the brook along with a farmhouse with multiple greenhouses. The site is moderately sloped from the southeast corner to the north-northwest.

Access to the new development will be provided by two new entrance drives, one off Clintonville Road to the south and one connecting to the Tuscan Villa development to the east. The new buildings and clubhouse will be served by the public water service located in Clintonville Road. A proposed sanitary sewer lateral will be installed to serve the two buildings and clubhouse and will connect to the existing sewer service running through the middle of the parcel. All other utilities such as electric, telephone, cable, and gas will be provided by the existing services adjacent to the project site and shall be located underground.

Figure 1 – 343 Clintonville Road, North Haven, Connecticut

Table 1 – Stormwater Data

Total Parcel Size	12.8 acres
Existing On-Site Impervious Area	0.4 acres
Proposed On-Site Impervious Area	3.1 acres
Soil Types (Hydrologic Soil Group)	"A," "B," and "C"
Existing Land Use	Woods, open space, straight row crops, gravel, bituminous, and building
Proposed Land Use	Woods, open space, gravel, bituminous, and building
Design Storm for Stormwater Management	No increases in peak rates of runoff for the 2-, 10-, 25-, 50-, and 100-year storms.
Design Storm for Storm Drainage	25-year storm
Federal Emergency Management Agency Special Flood Hazard Areas	Not applicable
Connecticut Department of Energy & Environmental Protection Aquifer Protection Areas	Not applicable

STORMWATER MANAGEMENT APPROACH

The stormwater management system for this site has been designed utilizing Best Management Practices (BMPs) to provide water quality management while attenuating the proposed peak-flow rates from the development. The design goal is to provide water quality treatment in accordance with the Connecticut Department of Energy & Environmental Protection (CTDEEP) requirements for Water Quality Volume (WQV) and prevent increases in the predevelopment runoff rates from the project site. Existing drainage patterns will be maintained to the maximum extent practicable, and a stormwater treatment train is proposed including several water quality measures such as catch basins with 2-foot sumps, a hydrodynamic separator, riprap energy dissipators, sediment forebays, and retention volume within the proposed stormwater management basin.

The proposed project will include one stormwater management basin that is designed to detain the proposed stormwater peak discharge rates and provide retention storage to address water quality. The detention basin is designated on the plans as Basin 210.

The computer program entitled *Hydraflow Storm Sewers Extension for AutoCAD® Civil 3D® 2019* by Autodesk, Inc., Version 10.5, was used for designing the proposed storm drainage collection system. Storm drainage computations performed include pipe capacity, hydraulic grade line, and gutter flow calculations. The contributing watershed to each individual catch basin inlet was delineated to determine drainage area and land coverage. These values were used to determine the stormwater runoff to each inlet using the Rational Method. The rainfall intensities for the site were obtained from the National Oceanic and Atmospheric Administration (NOAA) Atlas 14, Volume 10 Precipitation Frequency Data Server (PFDS). The proposed storm drainage system is designed to provide adequate pipe capacity to convey the 25-year storm event.

WATER QUALITY MANAGEMENT

Stormwater runoff from the proposed improvements will be collected by a subsurface pipe and catch basin drainage system. The proposed drainage system will include catch basins with 2-foot sumps to trap sediment and debris. In addition, a proprietary hydrodynamic separator is proposed as part of the main storm drainage system that discharges to Basin 210. The hydrodynamic separator was sized to meet Water Quality Flow (WQF) standards from CTDEEP's *2004 Stormwater Quality Manual*, which is the peak-flow rate associated with the WQV, and sized based on manufacturer's specifications, as recommended in the manual.

The stormwater management basin was sized following recommendations set forth in CTDEEP's *2004 Stormwater Quality Manual*. The manual (Chapter 7) recommends methods for sizing stormwater treatment measures with WQV computations. The WQV addresses the initial stormwater runoff, also commonly referred to as the "first flush" runoff. The WQV provides adequate volume to store the initial 1 inch of runoff, which tends to contain the highest concentrations of potential pollutants. The WQV has been provided within the volume of the proposed stormwater management basin below the first outlet discharge from the outlet control structure. All supporting calculations for the volume provided as well as WQV computations have been included in the Appendix of this report.

A sediment forebay is proposed around the proposed drainage pipe that daylights into the stormwater management basin, which will improve water quality by trapping floatables as well as filtering coarse sediment and other pollutants. Riprap splash pads will dissipate the potential erosive velocity of

stormwater entering the basin as well as trap sediment. The sediment forebay will contain the deposited sediment within a small area of the basin and allow for maintenance accessibility.

HYDROLOGIC ANALYSIS

A hydrologic analysis was conducted to analyze the predevelopment and post-development peak-flow rates from the site. Four analysis points consisting of four existing subwatersheds were chosen based on the fact that each area receives stormwater runoff from a portion of the project. Analysis Point A was created to analyze the portion of the site draining toward the western property boundary. Analysis Point B analyzes the portion of the site draining to the existing wetlands north of the proposed site. Analysis Point C analyzes the relatively small area that drains south toward Clintonville Road. Analysis Point D analyzes the portion of the site that drains to the eastern property. The total combined watershed area delineated is approximately 7.7 acres under both existing and proposed conditions.

The method of predicting the surface water runoff rates utilized in this analysis was a computer program entitled *Hydraflow Hydrographs Extension for AutoCAD® Civil 3D® 2019* by Autodesk, Inc., Version 2020. The *Hydrographs* program is a computer model that utilizes the methodologies set forth in the *Technical Release No. 55 (TR-55)* manual and the *Technical Release No. 20 (TR-20)* computer model, originally developed by the United States Department of Agriculture – Natural Resources Conservation Service (USDA-NRCS). The *Hydrographs* computer modeling program is primarily used for conducting hydrology studies such as this one.

The *Hydrographs* computer program forecasts the rate of surface water runoff based upon several factors. The input data includes information on land use, hydrologic soil type, vegetation, contributing watershed area, time of concentration, rainfall data, storage volumes, and the hydraulic capacity of structures. The computer model predicts the amount of runoff as a function of time, with the ability to include the attenuation effect due to dams, lakes, large wetlands, floodplains, and the stormwater management basin. The input data for rainfalls with statistical recurrence frequencies of 2, 10, 25, 50, and 100 years was obtained from the NOAA Atlas 14, Volume 10 database. The corresponding rainfall totals are listed below.

Storm Frequency	Rainfall (inches)
2-year	3.48
10-year	5.36
25-year	6.54
50-year	7.41
100-year	8.36

Land use for the site under existing and proposed conditions was determined from field survey and aerial photogrammetry. Land use types used in the analysis included woods, grassed or open space, building, impervious (paved) cover, gravel, and agriculture. Soil types in the watershed were determined from the CTDEEP Geographic Information System (GIS) database of the USDA-NRCS soil survey for New Haven County, Connecticut. For the analysis, the site was determined to contain hydrologic soil types "A," "B," and "C" as classified by USDA-NRCS. The different land uses and soil types were utilized to determine composite runoff Curve Numbers (CN) for each subwatershed. The time of concentration (Tc) was estimated for each subwatershed using the TR-55 methodology that was computed by summing all travel times through the watershed as sheet flow, shallow concentrated flow, and channel flow.

The existing conditions were modeled with the *Hydrographs* program to determine the peak-flow rates for the various storm events at each analysis point. A revised model was developed incorporating the proposed site conditions; the flows obtained with the revised model were then compared to the results of the existing conditions model. Peak-flow rates from the project site were controlled by the storage volume provided within the stormwater basin and the hydraulic capacity of the outlet control structure. Stormwater Management Basin 210 has been designed to provide a minimum of 1 foot of freeboard to the top of the embankment during the 100-year storm event. The following peak rates of runoff were obtained from the *Hydrographs* hydrology results:

Analysis Point A – Western Property Boundary – West					
	Peak Runoff Rate (cubic feet per second)				
Storm Frequency (years)	2	10	25	50	100
Existing Conditions	0.43	1.74	2.79	3.64	4.61
Proposed Conditions	0.01	0.19	0.59	1.04	1.62

Analysis Point B – Existing Wetland Boundary – North					
	Peak Runoff Rate (cubic feet per second)				
Storm Frequency (years)	2	10	25	50	100
Existing Conditions	0.52	3.85	7.05	9.76	12.94
Proposed Conditions	0.25	1.58	3.01	4.68	10.65

Detention Basin 210*					
	Water Surface Elevation (feet)				
Storm Frequency (years)	2	10	25	50	100
Proposed Conditions	58.17	59.33	60.03	60.43	60.71

*Top of basin berm elevation at 62.0 feet

Analysis Point C – Clintonville Road – Southeast					
	Peak Runoff Rate (cubic feet per second)				
Storm Frequency (years)	2	10	25	50	100
Existing Conditions	0.00	0.00	0.01	0.02	0.04
Proposed Conditions	0.00	0.04	0.09	0.13	0.18

Analysis Point D – Eastern Property Boundary – East					
	Peak Runoff Rate (cubic feet per second)				
Storm Frequency (years)	2	10	25	50	100
Existing Conditions	0.00	0.00	0.00	0.00	0.01
Proposed Conditions	0.00	0.00	0.00	0.00	0.01

CONCLUSION

The results of the hydrologic analysis demonstrate that there will be no increases in peak-flow rates from the proposed development at all but one point of analysis. The increase in peak flow for point of analysis C is the result of a proposed sidewalk connecting to the adjacent sidewalk in the right-of-way. This relatively small increase in peak flow to the analysis point is negligible and does not pose any negative downstream impact. The overall decrease in peak flows was achieved for the storm events modeled through a planned stormwater management system with detention provided in the proposed stormwater/water quality basin.

The proposed development will introduce a new stormwater treatment train consisting of several water quality measures such as catch basins with 2-foot sumps, a hydrodynamic separator, riprap energy dissipators, sediment forebay, and retention volume within the proposed stormwater/water quality basin. A hydrodynamic separator will be employed in the main storm drainage system that discharges to the stormwater basin (Basin 210) to enhance sediment removal. Furthermore, the sediment forebay will filter coarse sediment prior to stormwater runoff entering the detention basin. The CTDEEP WQV has been provided within the retention storage in the proposed stormwater/water quality basin.

All supporting documentation and stormwater-related computations are attached to this report along with the *Hydraflow Hydrographs* model results for stormwater management and the *Hydraflow Storm Sewers* model results for the proposed storm drainage system. Illustrative watershed maps for both existing and proposed conditions are also attached to this report.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:12,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
 Web Soil Survey URL:
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: State of Connecticut
 Survey Area Data: Version 20, Jun 9, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 27, 2014—Jul 22, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Totals for Area of Interest			36.2	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Outlet Protection Calculations

Project: 343 Clintonville Road (MMI: 2709-13)
Location: Greenwich, Connecticut
Outlet I.D.: **FES 1**

By: KVN
Checked:

Date: 12/08/20
Date:

*Based on Connecticut DOT Drainage Manual, Section 11.13

Description:

Preformed Scour Hole at FES 1

Design Criteria (25-yr Storm Event):

Q (cfs) = 19.16	R _p (ft) =	2
D (in) = 24	S _p (ft) =	2
V (fps) = 6.1	Tw (ft) =	4.03

Q= Flow rate at discharge point in cubic feet per second (cfs)

D= Outlet pipe diameter (in)

V= Flow velocity at discharge point (ft/s)

R_p= Maximum inside pipe rise (ft)

S_p= inside diameters for circular sections of maximum inside pipe span for non-circular sections (ft)

T_w= Tailwater depth (ft)

Based on Table 11.13.1, A Preformed Scour Hole is used One Half Pipe Rise Depression (Type 1)

Rip Rap Stone Size:

<u>D₅₀ Computed (in)</u>	<u>Rip Rap Specification</u>	<u>D₅₀ Stone Size Required</u>
0.8	Modified	5 inches

Preformed Scour Hole Dimensions:

F = 0.5(R _p)	=	1 ft
C = 3.0(S _p)+6.0(F)	=	12 ft
B = 2.0(S _p)+6.0(F)	=	10 ft
d (Depth of Stone)	=	12 inches

WATER QUALITY COMPUTATIONS

**STORMWATER QUALITY CALCULATIONS:
Water Quality Volume**

Basin ID	Total Area (ac.)	Impervious Area (ac.)	Percent Impervious	Volumetric Runoff Coeff., R	WQV (ac-ft)	Total Volume Required (ac-ft)	Total Volume Provided (ac-ft)
DET 210	5.020	2.984	59%	0.58	0.245	0.245	<i>0.254</i>

$$WQV = \frac{(1.0 \text{ inches}) \times A \times R}{12}$$

Where: WQV = Water Quality Volume in acre-feet

A = Contributing Area in acres

R = 0.05 + 0.009 (I)

I = Site Imperviousness as percent

STORMWATER QUALITY CALCULATIONS
Total Storage Volume Provided

Detention Basin 110:

Elevation (ft)	Surface Area (ft²)	Volume (ft³)	Volume (ac-ft)	Cumulative Volume (ac-ft)
56.0	4,392	0.0	0.000	0.000
57.0	5,850	5,121.0	0.118	0.118
57.9	7,384	5,955.3	0.137	0.254

The following depicts sizing for the proposed stormwater treatment device (Contech CDS Unit) used to remove total suspended solids and other pollutants prior to discharge into the detention basin. Computations and supportive documentation have been included within the Engineering Report.

CDS Unit (MH 2)

WQF = 2.31 cubic feet per second, cfs

Model: CDS2025-5 (5' MH Diameter)

	MILONE AND MACBROOM, INC.				Project	2709-13

					Chkd by:	
					Date:	
MH 2 (CDS UNIT)						
Contributing Basins	Wooded Area (acres)	Grass Area (acres)	Imperv. Area (acres)	Total Area (acres)		
Total	0.2	1.35	2.86	4.37		
Table 4.1: $WQV = (P)(R_v)(A)/12 =$				0.233	acre-feet	
Where:						
I = % of Impervious Cover =				65%		
$R_v =$ volumetric runoff coeff. $0.05 + 0.009(I) =$				0.639		
P = design precipitation (1.0" for water quality storm) =				1	inch	
A = site area (acres) =				4.37	acres =	0.0068 miles ²
Q = runoff depth (in watershed inches) = $[WQV(\text{acrefeet})][12(\text{inches/foot})]/\text{drainage area (acres)}$						
			Q =	0.639		
$CN = 1000 / [10 + 5P + 10Q - 10(Q^2 + 1.25QP)^{0.5}] =$				96		
Where:						
Q = runoff depth (in watershed inches)						
			$t_c =$	0.278	hours	
Type III Rainfall Distribution:						
From Table 4-1, $I_a =$		0.083	$I_a/P =$		0.083	
(TR-55)						
From Exhibit 4-III, $q_u =$		530	csm/in.			
(TR-55)						
$WQF = (q_u)(A)(Q) =$		2.31	cfs			

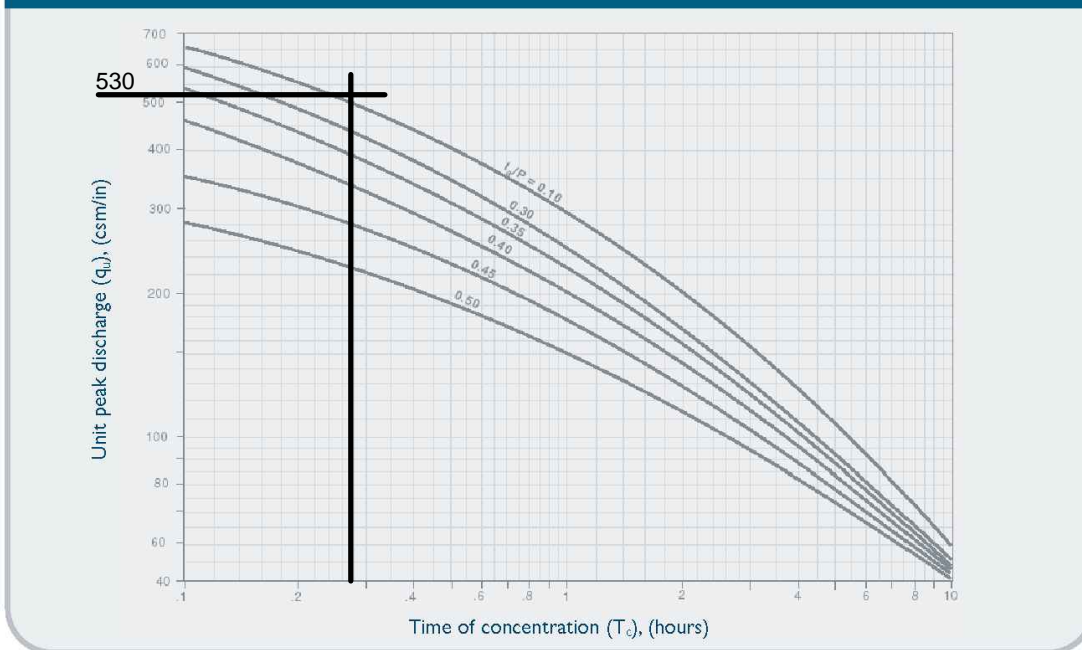

2. Compute the time of concentration (t_c) based on the methods described in Chapter 3 of TR-55. A minimum value of 0.167 hours (10 minutes) should be used. For sheet flow, the flow path should not be longer than 300 feet.
3. Using the computed CN, t_c , and drainage area (A) in acres, compute the peak discharge for the water quality storm (i.e., the water quality flow [WQFI]), based on the procedures described in Chapter 4 of TR-55.
 - Read initial abstraction (I_a) from Table 4-1 in Chapter 4 of TR-55 (reproduced below); compute I_a/P

Table 4-1 I_a values for runoff curve numbers

Curve number	I_a (in)	Curve number	I_a (in)	Curve number	I_a (in)	Curve number	I_a (in)
40	3.000	55	1.636	70	0.857	85	0.353

Hydrodynamic Separation Southern New England

The experts you need to solve your stormwater challenges

Contech is the leader in stormwater solutions, helping engineers, contractors and owners with infrastructure and land development projects throughout North America.

With our responsive team of stormwater experts, local regulatory expertise and flexible solutions, Contech is the trusted partner you can count on for stormwater management solutions.

Your Contech Team

STORMWATER CONSULTANT

It's my job to recommend the best solution to meet permitting requirements.

STORMWATER DESIGN ENGINEER

I work with consultants to design the best approved solution to meet your project's needs.

REGULATORY MANAGER

I understand the local stormwater regulations and what solutions will be approved.

SALES ENGINEER

I make sure our solutions meet the needs of the contractor during construction.

Contech is your partner in stormwater management solutions

Removing Pollutants using Hydrodynamic Separation

HDS systems play a vital role in protecting our waterways by removing high levels of sediment, trash, debris, and hydrocarbons from stormwater runoff.

Frequently used as end-of-pipe solutions, they are also used to provide stormwater quality treatment in places where space is limited.

HDS systems capture and retain a variety of stormwater pollutants and are very easy to maintain. These two key benefits have resulted in new uses for HDS technologies, such as pretreating detention, Low Impact Development, and green infrastructure practices, as well as other land-based stormwater treatment systems.

Utilize high-performance hydrodynamic separation to effectively remove finer sediment, oil and grease, and floating and sinking debris.

CASCADE
separator™

Stormceptor®
-----STC

The Cascade Separator™ System

Advanced Sediment Capture Technology ...

The Cascade Separator™ is the newest innovation in stormwater treatment from Contech. The Cascade Separator was developed by Contech's stormwater experts using advanced modeling tools and Contech's industry leading stormwater laboratory.

This innovative hydrodynamic separator excels at sediment capture and retention while also removing hydrocarbons, trash, and debris from stormwater runoff. What makes the Cascade Separator unique is the use of opposing vortices that enhance particle settling and a unique skirt design that allows for sediment transport into the sump while reducing turbulence and resuspension of previously captured material. These two factors allow the Cascade Separator to treat high flow rates in a small footprint, resulting in an efficient and economical solution for any site.

FEATURE	BENEFIT
Unique skirt design & opposing vortices	Superior TSS removal; reduced system size and costs
Inlet area accepts wide range of inlet pipe angles	Design and installation flexibility
Accepts multiple inlet pipes	Eliminates the need for separate junction structure
Grate inlet option	Eliminates the need for a separate grate inlet structure
Internal bypass	Eliminates the need for a separate bypass structure
Clear access to sump and stored pollutants	Fast, easy maintenance

Learn More:
www.ContechES.com/cascade

SELECT CASCADE APPROVALS

- New Jersey Department of Environmental Protection Certification (NJDEP)

CASCADE MAINTENANCE

Cascade provides unobstructed access to stored pollutants, making it easy to maintain using a vacuum truck, with no requirement to enter the unit.

The CDS® System

Superior TSS and Trash Removal ...

The CDS is a hybrid technology that uses a combination of swirl concentration and indirect screening to separate and trap sediment, trash, debris, and hydrocarbons from stormwater runoff.

At the heart of the CDS system is a unique screening technology used to capture and retain sediment. The screen face is louvered so that it is smooth in the downstream direction. The effect created is called "Continuous Deflective Separation." The power of the incoming flow is harnessed to continually shear debris off the screen and to direct trash and sediment toward the center of the separation cylinder. This results in a screen that is self-cleaning and provides 100% removal of floatables and neutrally buoyant material debris 2.4 mm or larger, without blinding.

FEATURE	BENEFIT
Unique flow path and isolated storage sump	Excellent TSS capture and retention
Captures and retains 100% of floatables and neutrally buoyant debris 2.4 MM or larger	Superior trash removal
Self-cleaning screen	Ease of maintenance
Inline, offline, multiple inlet pipes, grate inlet, and drop inlet configurations available	Design flexibility
Internal bypass	Eliminates the need for additional structures
Clear access to sump and stored pollutants	Fast, easy maintenance

Learn More:
www.ContechES.com/cds

SELECT CDS APPROVALS

- Washington Department of Ecology (GULD) – Pretreatment
- New Jersey Department of Environmental Protection Certification (NJDEP)
- Canadian Environmental Technology Verification (ETV)
- MASTEP
- Connecticut DOT

The CDS system has been accepted and used extensively in all New England states for over 20 years with thousands of installations.

The Vortechs® System

Stormwater Treatment in a Shallow Footprint ...

Vortechs combines swirl concentration and flow controls into a single treatment unit that captures and retains trash, debris, sediment, and hydrocarbons from stormwater runoff.

The Vortechs system's large swirl chamber and flow controls work together to create a low energy environment, ideal for capturing and retaining particles down to 50 microns.

Vortechs is the ideal solution for sites with high groundwater, bedrock, utility conflicts, or sites with a large volume runoff.

The Vortechs System is approved by the Washington Department of Ecology (GULD) - Pretreatment.

Learn More:
www.ContechES.com/vortechs

SELECT VORTECHS APPROVALS

- Washington Department of Ecology (GULD) – Pretreatment
- MASTEP
- Connecticut DOT

FEATURE	BENEFIT
Large swirl chamber	Fine particle removal down to 50 microns
Shallow profile – Typical depth below pipe invert is only 3 feet.	Can be used on sites with high groundwater, bedrock, or utility conflicts
Unobstructed access to stored pollutants	Fast, easy maintenance

The Vortechs System was developed in New England and has been used extensively in the region for over 20 years.

The ideal solution for sites with high groundwater

Stormceptor® STC

Stormceptor STC is the recognized leader in stormwater treatment, offering a range of versatile treatment systems that effectively remove pollutants from stormwater and snowmelt runoff. Stormceptor is flexibly designed to protect waterways from hazardous material spills and stormwater pollution, including suspended sediment, free oils, and other pollutants that attach to particles, no matter how fierce the storm.

Stormceptor's scour prevention technology ensures pollutants are captured and contained during all rainfall events.

Ideal uses

- Sediment (TSS) removal
- Spill control
- Debris and small floatables capture
- Pretreatment for filtration, detention/retention systems, ponds, wetlands, Low Impact Development (LID), green infrastructure, and water-sensitive urban design

Proven performance

With more than 20 years of industry experience, Stormceptor has been performance tested and verified by some of the most stringent technology evaluation programs in North America.

- NJCAT
- Washington Ecology to Washington Department of Ecology (GULD) – Pretreatment
- EN858 Class 2

Learn More:

www.ContechES.com/stormceptor

FEATURE	BENEFIT
Patented scour prevention technology	Superior pollutant removal and retention
Can take the place of a conventional junction or inlet structure	Eliminates the need for additional structures
Minimal drop between inlet and outlet	Site flexibility
Multiple inlets can connect to a single unit	Design flexibility
3rd party tested and verified performance (Sediment & Oil)	Eliminates the need for a separate bypass structure

With over 40,000 units operating worldwide, Stormceptor performs and protects every day, in every storm.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.
